Initial Value Problem

$$\left\{ \begin{array}{l} y' = 5 - x^2 - y^2 + 2xy \\ y(0) = 1 \\ x \in (0, 20) \end{array} \right\}$$

Solution:

1. This is Nonlinear Non-homogeneous First order Differential Equation

$$y' = 5 - (y - x)^2 \tag{1}$$

2. Let's use the substitution $z(x) = y - x$:

$$\begin{aligned} y &= z + x \\ y' &= z' + 1 \end{aligned} \tag{2}$$

3. After substitution we obtain:

$$\begin{aligned} z' + 1 &= 5 - z^2 \\ z' &= -z^2 + 4 \end{aligned} \tag{3}$$

4. We got Riccati equation with particular solution $z = 2$. Now special substitution for Riccati equation can be applied:

$$\begin{aligned} u(x) &= \frac{1}{z-2} \\ z(x) &= \frac{1}{u} + 2 \\ z' &= -\frac{1}{u^2}u' \end{aligned} \tag{4}$$

5. If we substitute (4) into (3) we will get:

$$\begin{aligned} -\frac{1}{u^2}u' &= -(\frac{1}{u} + 2)^2 + 4 \\ u' - 4u &= 1 \end{aligned} \tag{5}$$

6. We got Linear Differential Equation which can be solved in form:

$$u = (\int 1 * e^{-4x}dx + C)e^{4x}$$
$$u = Ce^{4x} - \tfrac{1}{4} \tag{6}$$

7. As $z = \tfrac{1}{u} + 2$ we get:

$$z = \frac{1}{Ce^{4x} - \tfrac{1}{4}} + 2 \tag{7}$$

8. From (2) $y = z + 2$, so we obtain the General Solution of our ODE:

$$y = \frac{1}{Ce^{4x} - \tfrac{1}{4}} + 2 + x, \text{ where } C \in \mathbb{R} \tag{8}$$

9. As we are solving IVP:

$$\left\{ \begin{array}{l} y = \frac{1}{Ce^{4x}-\tfrac{1}{4}} + x + 2 \\ y(x_0) = y_0 \end{array} \right\}$$

$$y_0 = \frac{1}{Ce^{4x_0}-\tfrac{1}{4}} + x_0 + 2$$
$$C = e^{-4x_0}\left(\frac{1}{y_0-x_0-2} + \tfrac{1}{4}\right) \tag{9}$$

10. Let's substitute obtained value of C to get Exact Solution:

$$y = \frac{1}{e^{-4x_0}(\frac{1}{y_0-x_0-2}+\frac{1}{4})e^{4x}-\frac{1}{4}} + x + 2 \tag{10}$$

11. Now we can investigate discontinuity points:

    (a) Firstly, C does not exist when $y_0 - x_0 = 2$:

$$y_0 - x_0 \neq 2 \tag{11}$$

    (b) If $C \leqslant 0$, then the determinant of (8) is always nonzero and there is no discontinuity points there

(c) If $C > 0$, then the determinant of (8) can be equal to zero

$$C > 0$$
$$e^{-4x_0}\left(\frac{1}{y_0-x_0-2} + \frac{1}{4}\right) > 0 \tag{12}$$
$$y_0 - x_0 < -2$$

Now let's consider determinant of (10):

$$e^{-4x_0}\left(\frac{1}{y_0-x_0-2} + \frac{1}{4}\right)e^{4x} - \frac{1}{4} \neq 0$$
$$x \neq \frac{1}{4}\log\left(\frac{1}{4}e^{4x_0}\left(\frac{1}{y_0-x_0-2} + \frac{1}{4}\right)^{-1}\right) \tag{13}$$
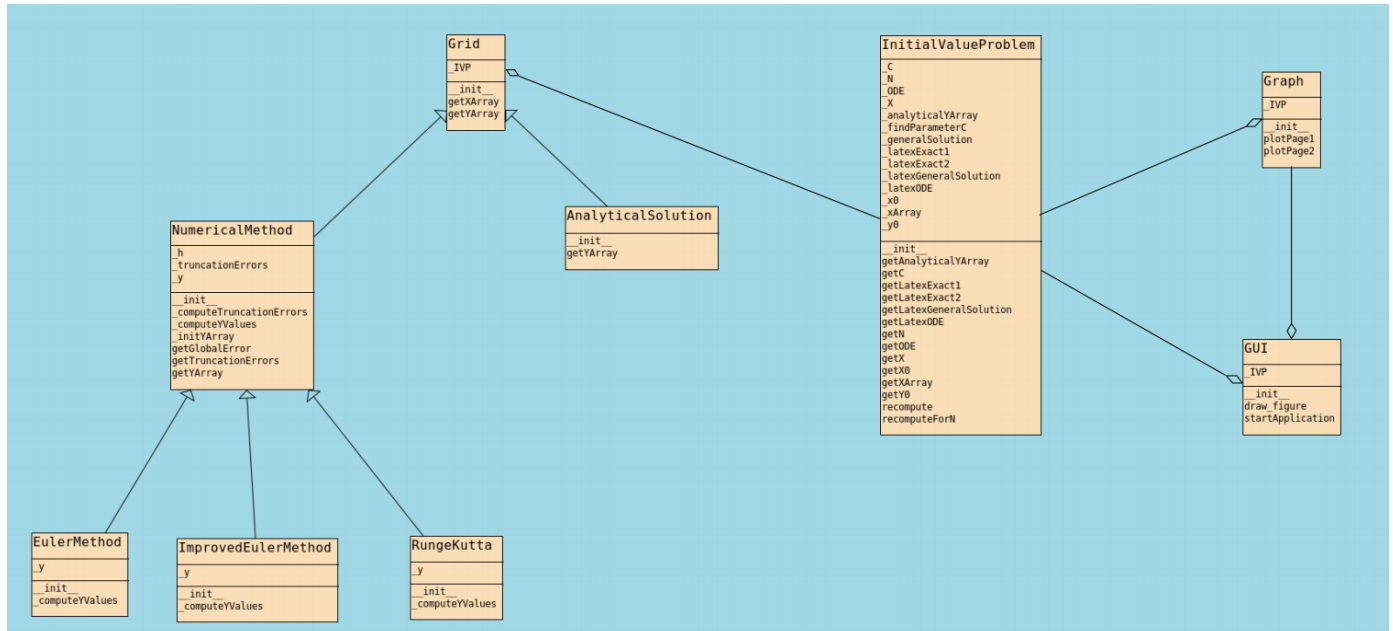

Answer:

Given equation does not have trivial solution and has the most general nontrivial solution in form: $y = \frac{1}{e^{-4x_0}\left(\frac{1}{y_0-x_0-2}+\frac{1}{4}\right)e^{4x}-\frac{1}{4}} + x + 2$ on

$$\left\{ \begin{array}{c} x \,|\, x \in \mathbb{R} \wedge x_0 \in \mathbb{R} \wedge y_0 \in \mathbb{R} \wedge (y_0 - x_0 \neq 2) \wedge \\ ((y_0 - x_0 < -2) \wedge x \neq \frac{1}{4}\log\left(\frac{1}{4}e^{4x_0}\left(\frac{1}{y_0-x_0-2} + \frac{1}{4}\right)^{-1}\right)) \end{array} \right\}$$
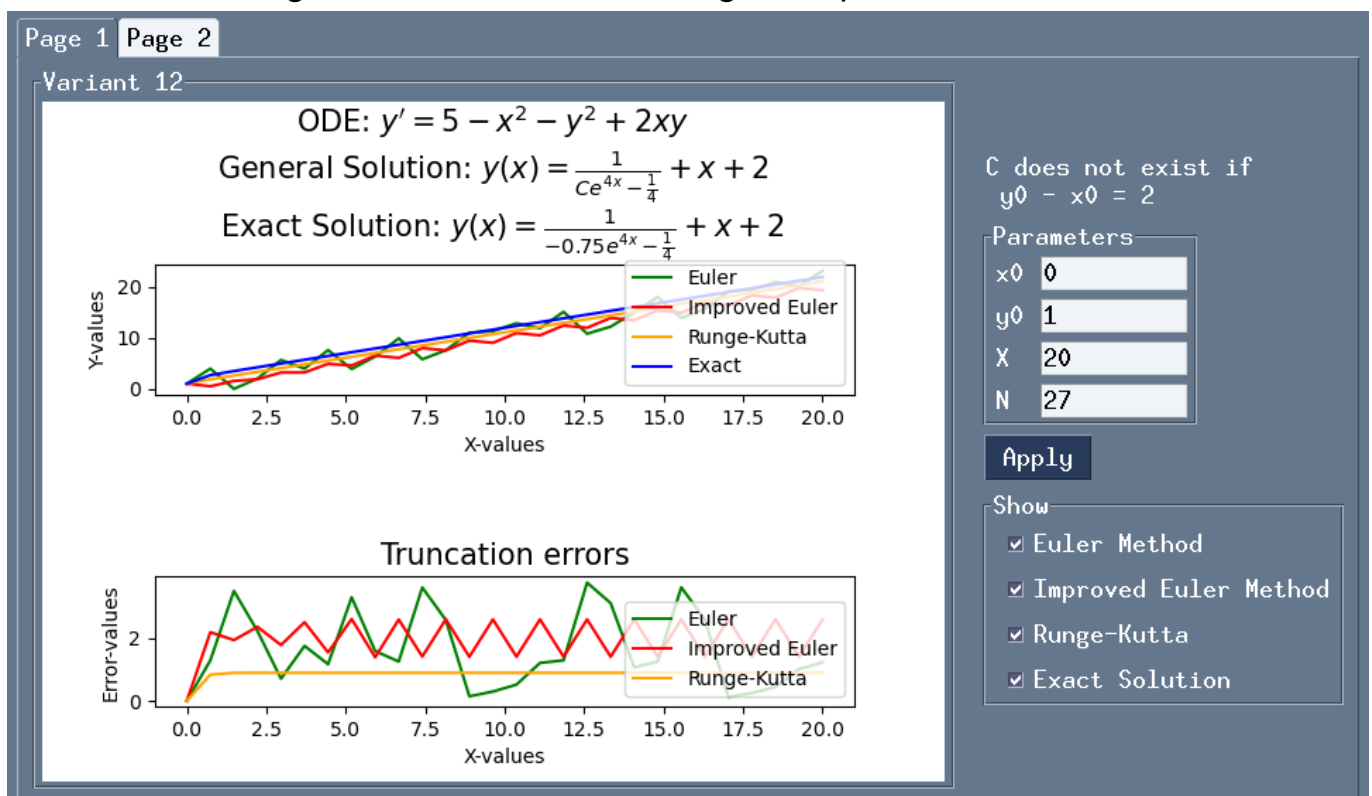

Programming Part

The application was written in Python with the use of NumPy, MatPlotLib, and PySimpleGUI.
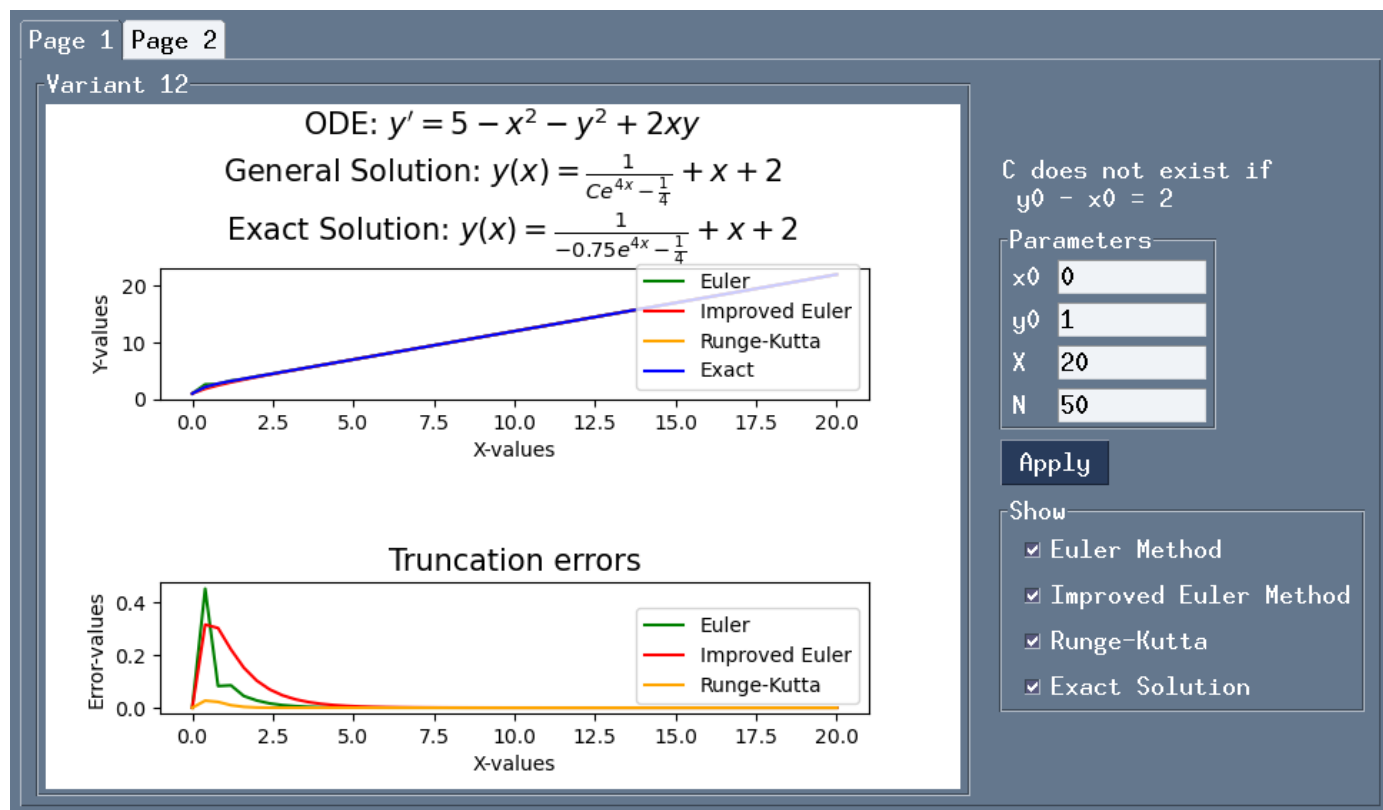

UML Diagram:

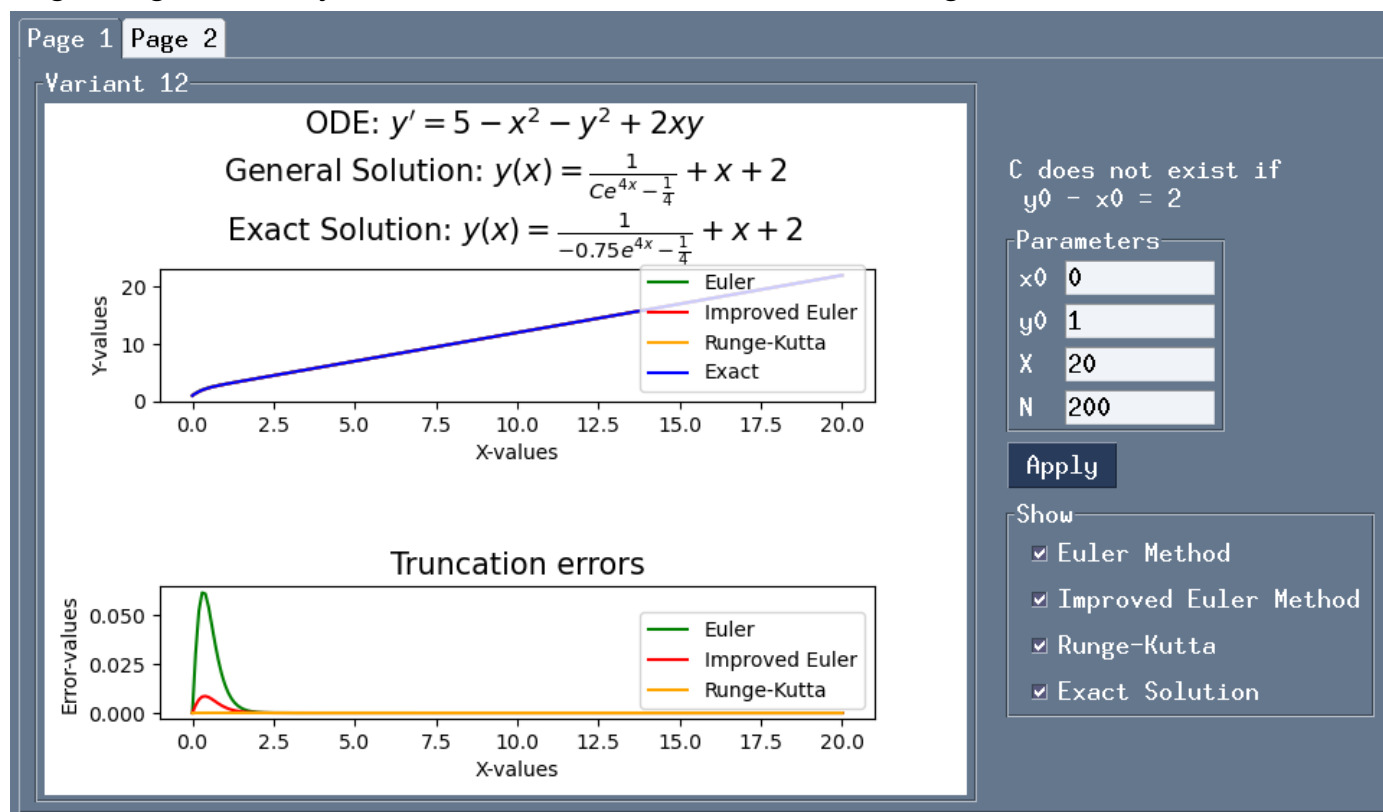

Numerical investigations:

Let's look at the graphs of IVP var12 with 27 grid steps. We can observe that Euler method and Improved Euler's method are not precise, and Runge-Kutta method shows a good result even with this grid steps size.

With 50 grid steps, Euler method and Improved Euler's method have significant errors in the beginning while Runge-Kutta method has almost zero errors during the whole interval. After the first quarter, all the methods have almost zero errors.

Page 1 | Page 2

Variant 12

ODE: $y' = 5 - x^2 - y^2 + 2xy$

General Solution: $y(x) = \frac{1}{Ce^{4x} - \frac{1}{4}} + x + 2$

Exact Solution: $y(x) = \frac{1}{-0.75e^{4x} - \frac{1}{4}} + x + 2$

C does not exist if
$y0 - x0 = 2$

Parameters

x0 0
y0 1
X   20
N   50

Apply

Show
☑ Euler Method
☑ Improved Euler Method
☑ Runge-Kutta
☑ Exact Solution

Truncation errors

With 200 grid steps size, only Euler's method shows significant error in the beginning but finally, truncation errors of all the methods go to zero.

Page 1 | Page 2

Variant 12

ODE: $y' = 5 - x^2 - y^2 + 2xy$

General Solution: $y(x) = \frac{1}{Ce^{4x} - \frac{1}{4}} + x + 2$

Exact Solution: $y(x) = \frac{1}{-0.75e^{4x} - \frac{1}{4}} + x + 2$

C does not exist if
$y0 - x0 = 2$

Parameters

x0 0
y0 1
X   20
N   200

Apply

Show
☑ Euler Method
☑ Improved Euler Method
☑ Runge-Kutta
☑ Exact Solution

Truncation errors

As we can conclude: Runge-Kutta method is the most precise one, and Euler's method is the most inaccurate.

Investigation of graphs of Global Errors:
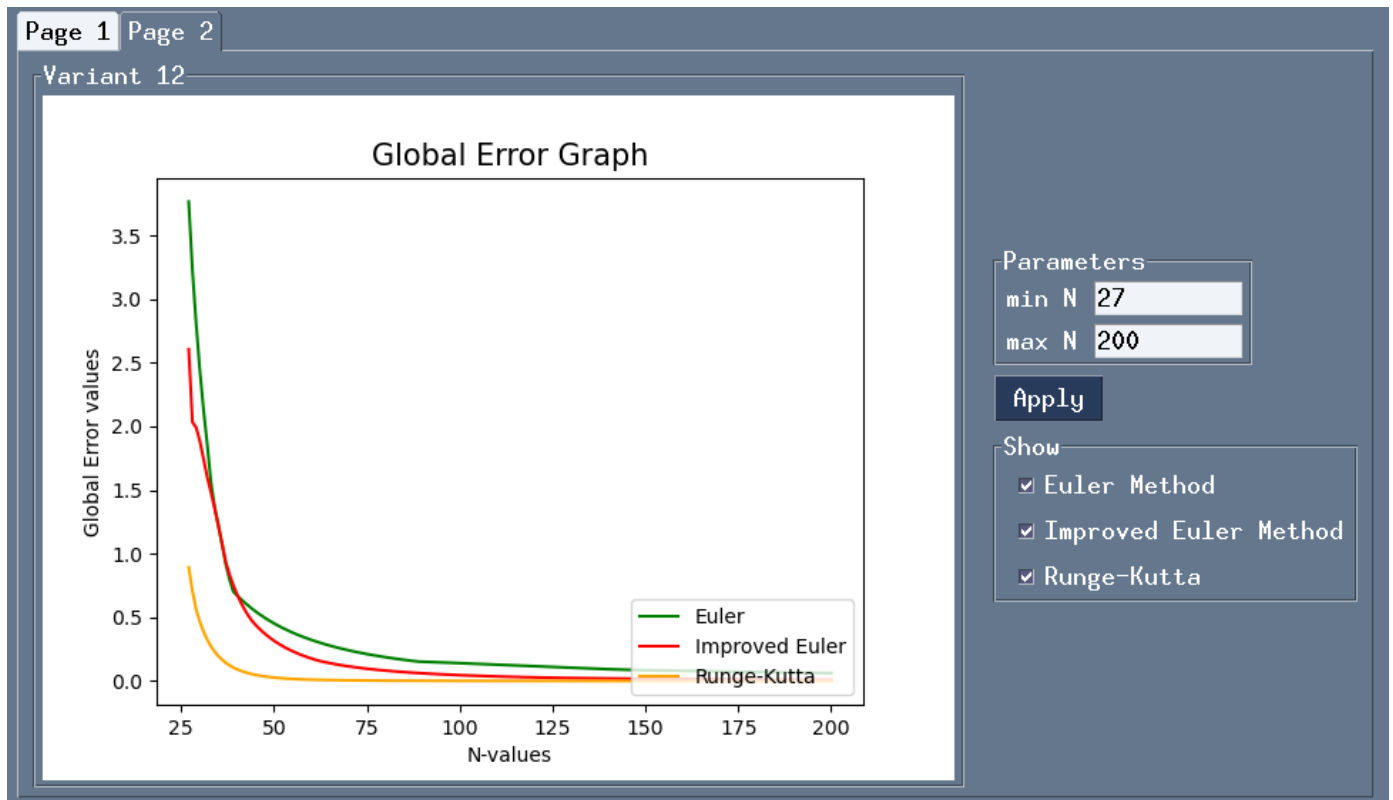

By increasing the number of steps we achieve almost absolute accuracy for Improved Euler's method and for Runge-Kutta method.
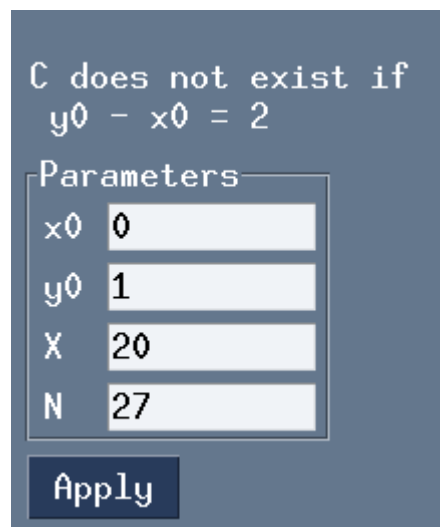

Some Implementation Features:

In my application, the user does not need to create separate classes for different variants of IVP. To start the application for the chosen variant the user should create an instance of the class "InintialValueProblem" and initialize it with appropriate lambda expressions for ODE and LaTeX expressions for GUI printing. After these actions, the user creates an instance of GUI for chosen variant and starts the application.

```python
# Create instane of IVP for variant 12
var12 = InitialValueProblem(ODE=lambda x,y: 5 - (y - x) ** 2, # y' = f(x,y)
                            findParameterC=lambda x,y: np.exp(-4 * x) * (1 / (y - x - 2) + 1 / 4), # C = k(x, y)
                            generalSolution=lambda x,C: 1 / (C * np.exp(4 * x) - 1 / 4) + x + 2, # y = g(x, C)
                            x0=0, y0=1, X=20, N=27,
                            # Latex strings for GUI printing
                            latexODE=r"$y'=5-x^{2}-y^{2}+2xy$",
                            latexGeneralSolution=r'$y(x)=\frac{1}{Ce^{4x}-\frac{1}{4}}+x+2$',
                            # Latex expression is separated in place where constant C should be substituted
                            latexExact1=r'$y(x)=\frac{1}{', # Here value of C will bw placed
                            latexExact2=r'e^{4x}-\frac{1}{4}}+x+2$', # Remaining part of the string after C
                            exception='C does not exist if\n y0 - x0 = 2')

GUI(var12).startApplication()
```

Also, it is possible to add some hint's for the user of GUI by initializing the field "exception" in class "InitialValueProblem":

Conclusion:

As a result of the practicum, an application was written to demonstrate the performance of different numerical methods for approximation of ordinary differential equations solutions.
